

Producers, consumers, and decomposers

All living things need energy. Depending on how they get their energy, living things are either producers, consumers, or decomposers.

Producers make their own energy from sunlight, air, and soil.

Consumers cannot make their own energy. They must eat other living things.

Decomposers break down and eat dead plants and animals

Write producer, consumer, or decomposer for each living thing.

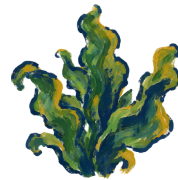

oak tree — _____

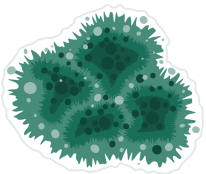

slug — _____

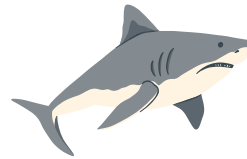

bald eagle — _____

seaweed (kelp) — _____

mold (fungus) — _____

white shark — _____

sunflower — _____

bracket mushroom — _____

zebra — _____

frog — _____
